

giving as a reason that his conspicuous dress was a target for his enemies; which is the usual way we try to make other people think we know something. So I will now describe the following year's events, which was 1895. A female Scarlet Tanager came and built exactly on the same spot where the previous year's nest was; hence I infer it was the same female. But what of her gay lord, was he the same male? If so he must have undergone a great change of character, for he showed himself about the tree frequently and sang on the next tree very often during the day. But the most remarkable thing of all was, he spied a nest of Chippy Sparrows (*Spizella socialis*) with young ones. To my surprise he kept going to the nest and fed the baby Chippys, much to the disgust of their parents, who kept hovering around with food in their mouths which the little things could not take, after being fed so often by their gorgeous foster father. This was continued for a number of days. When his own precious young burst their shells and required attention he then left the Chippys to their rightful parents, which were now outgrowing their narrow domicile, being duly cared for. Mr. Tanager now paid as faithful attention to his own family, feeding them very frequently and singing his sweet song between feeding and collecting food. Seldom was he away, near sunset, longer than ten or fifteen minutes. So I am at a loss to account for the shyness shown the previous year, unless this was a second husband of the same female Tanager; and then the extraordinary fact of his feeding other birds' young ones is one of the exceptions that make the study of birds a pleasant recreation.—HENRY HALES, *Ridgewood, N. Y.*

**The Occurrence in Nebraska of *Vireo flavoviridis*.**—A specimen of the Yellow-green Vireo, *Vireo flavoviridis*, shot at Long Pine, Brown County, has just been received by the Curator of the Museum of the University of Nebraska. This is the first one reported in this State. It is a rare Vireo for the entire United States having been reported, as far as the author can learn, from Texas, California, and Canada only.

The specimen was shot and donated by the Rev. J. M. Bates of Long Pine, who has already done a great deal to further the knowledge of our native birds.

This adds one more to Prof. Lawrence Bruner's List of Nebraska Birds, recently published by the Nebraska State Horticultural Society. The total number of species and sub-species for the State is now 418.—ERWIN H. BARBOUR, *University of Nebraska, Lincoln, Nebr.*

***Helminthophila rubricapilla* vs. *Helminthophila ruficapilla*.**—The A. O. U. Committee appear to have ignored their rule "Once a synonym always a synonym," in the case of the Nashville Warbler. The West Indian *Dendroica ruficapilla* was called *Sylvia ruficapilla* by Latham in 1790 (Ind. Orn., II, 540). Wilson applied the same name to the Nashville Warbler in 1811 (Amer. Orn., III, 120). Whether by design or by
